● DESCRIPTION :

Today's consumers demand the best in audio/voice. They want crystal-clear sound wherever they are in whatever format they want to use. APLUS delivers the technology to enhance a listener's audio/voice experience.

The aPR2060 is powerful audio processor along with high performance audio analog-to-digital converters (ADCs) and digital-to-analog converters (DACs). The aPR2060 are a fully integrated solution offering high performance and unparalleled integration with analog input, digital processing and analog output functionality. The aPR2060 incorporates all the functionality required to perform demanding audio/voice applications. High quality audio/voice systems with lower bill-of-material costs can be implemented with the aPR2060 because of its integrated analog data converters and full suite of quality-enhancing features such as sample-rate convertor.

The aPR2060 H2.2 is specially designed for 2 key trigger, user can record and playback the voice message by switch, It is suitable in simple interface or need to limit the length of single message, e.g. toys, leave messages system, answering machine etc.

Meanwhile, this mode provides the power-management system. Users can let the chip enter power-down mode when unused. It can effectively reduce electric current consuming to 10uA and increase the using time in any projects powered by batteries.

● RECORD MESSAGE :

- Start record voice message :

When the [M0] key drove to VIL [VSS] in record mode, the chip will playback “beep” tone and M2 LED on and message record starting.

- Stop record voice message :

The message record will continue until [M0] key released or full of this message, the chip will play “beep” tone to indicate the message stop record and LED off.

If the message already exist and user record again, the old one's message will be replaced.

● PLAYBACK MESSAGE :

- Start playback voice message :

When the [M1] key drove from VIH to VIL in playback mode, the message playback starting and LED on.

- Stop playback voice message :

The message playback will continue until [M1] key drove from VIH to VIL again or end of this message and LED off.

Note: After reset, M0 to M1 pin will be pull-up to VDD by internal resistor.
