

2 A Output Current, High Speed MOSFET Gate Driver Optocoupler

FOD3180

Description

The FOD3180 is a 2 A Output Current, High Speed MOSFET Gate Drive Optocoupler. It consists of a aluminium gallium arsenide (AlGaAs) light emitting diode optically coupled to a CMOS detector with PMOS and NMOS output power transistors integrated circuit power stage. It is ideally suited for high frequency driving of power MOSFETs used in Plasma Display Panels (PDPs), motor control inverter applications and high performance DC/DC converters.

The device is packaged in an 8-pin dual in-line housing compatible with 260°C reflow processes for lead free solder compliance.

Features

- Guaranteed Operating Temperature Range of -40°C to +100°C
- 2 A Minimum Peak Output Current
- High Speed Response: 200 ns Max Propagation Delay over Temperature Range
- 250 kHz Maximum Switching Speed
- 30 ns Typ Pulse Width Distortion
- Wide V_{CC} Operating Range: 10 V to 20 V
- 5000 Vrms, 1 Minute Isolation
- Under Voltage Lockout Protection (UVLO) with Hysteresis
- Minimum Creepage Distance of 7.0 mm
- Minimum Clearance Distance of 7.0 mm
- C-UL, UL and VDE* Approved
- R_{DS(ON)} of 1.5 Ω (Typ.) Offers Lower Power Dissipation
- 15 kV/μs Minimum Common Mode Rejection
- These are Pb-Free Devices

Applications

- Plasma Display Panel
- High Performance DC/DC Convertor
- High Performance Switch Mode Power Supply
- High Performance Uninterruptible Power Supply
- Isolated Power MOSFET Gate Drive

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Derate linearly above +70°C free air temperature at a rate of 0.3 mA/°C.
2. The output currents I_{OH} and I_{OL} are specified with a capacitive current limited load = (3 x 0.01 μF) + 0.5 Ω, frequency = 8 kHz, 50% DF.
3. Derate linearly above +87°C, free air temperature at the rate of 0.77 mW/°C. Refer to Figure 13.
4. No derating required across operating temperature range.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V _{CC} – V _{EE}	Power Supply	10 to 20	V
I _{F(ON)}	Input Current (ON)	10 to 16	mA
V _{F(OFF)}	Input Voltage (OFF)	-3.0 to 0.8	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

*Typical values at $T_A = 25^\circ\text{C}$

9. t_{PHL} propagation delay is measured from the 50% level on the falling edge of the input pulse to the 50% level of the falling edge of the V_O signal. t_{PLH} propagation delay is measured from the 50% level on the rising edge of the input pulse to the 50% level of the rising edge of the V_O signal.
10. PWD is defined as $|t_{PHL} - t_{PLH}|$ for any given device.
11. The difference between t_{PHL} and t_{PLH} between any two FOD3180 parts under same test conditions.
12. Pin 1 and 4 need to be connected to LED common.
13. Common mode transient immunity in the high state is the maximum tolerable dV_{CM}/dt of the common mode pulse V_{CM} to assure that the output will remain in the high state (i.e. $V_O > 10.0\text{ V}$).
14. Common mode transient immunity in a low state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in a low state (i.e. $V_O < 1.0\text{ V}$).

OUTPUT POWER DERATING

The maximum package power dissipation is 295 mW. The package is limited to this level to ensure that under normal operating conditions and over extended temperature range that the semiconductor junction temperatures do not exceed 125°C. The package power is composed of three elements; the LED, static operating power of the output IC, and the power dissipated in the output power MOSFET transistors. The power rating of the output IC is 250 mW. This power is divided between the static power of the integrated circuit, which is the product of I_{DD} times the power supply voltage ($V_{DD} - V_{EE}$). The maximum IC static output power is 150 mW, ($V_{DD} - V_{EE}$) = 25 V, I_{DD} = 6 mA. This maximum condition is valid over the operational temperature range of -40°C to +100°C. Under these maximum operating conditions, the output of the power MOSFET is allowed to dissipate 100 mW of power.

The absolute maximum output power dissipation versus ambient temperature is shown in Figure 13. The output driver is capable of supplying 100 mW of output power over the temperature range from -40°C to 87°C. The output derates to 90 mW at the absolute maximum operating temperature of 100°C.

Figure 13. Absolute Maximum Power Dissipation vs. Ambient Temperature

The output power is the product of the average output current squared times the output transistor's $R_{DS(ON)}$:

$$P_{O(AVG)} = I_{O(AVG)}^2 \cdot R_{DS(ON)} \quad (\text{eq. 1})$$

The $I_{O(AVG)}$ is the product of the duty factor times the peak current flowing in the output. The duty factor is the ratio of the 'on' time of the output load current divided by the period of the operating frequency. An $R_{DS(ON)}$ of 2.0 Ω results in an average output load current of 200 mA. The load duty factor is a ratio of the average output time of the power MOSFET load circuit and period of the driving frequency.

The maximum permissible, operating frequency is determined by the load supplied to the output at its resulting output pulse width. Figure 14 shows an example of a 0.03 μF gate to source capacitance with a series resistance of 8.50 Ω . This reactive load results in a composite average pulse width of 1.5 μs . Under this load condition it is not necessary to derate the absolute maximum output current until the frequency of operation exceeds 63 kHz.

Figure 14. Output Current Derating vs. Frequency

I_{OH} AND I_{OL} TEST CONDITIONS

This device is tested and specified when driving a complex reactive load. The load consists of a capacitor in the series with a current limiting resistor. The capacitor represents the gate to source capacitance of a power MOSFET transistor. The test load is a 0.03 μF capacitor in series with an 8.5 Ω resistor. The LED test frequency is 10.0 kHz with a 50% duty cycle. The combined I_{OH} and I_{OL} output load current duty factor is 0.6% at the test frequency.

Figure 15 illustrates the relationship of the LED input drive current and the device's output voltage and sourcing and sinking currents. The 0.03 μF capacitor load represents the gate to source capacitance of a very large power MOSFET transistor. A single supply voltage of 20 V is used in the evaluation.

Figure 16 shows the test schematic to evaluate the out-put voltage and sourcing and sinking capability of the device. The I_{OH} and I_{OL} are measured at the peak of their respective current pulses.
