

## MEMS motion sensor: 3-axis digital output gyroscope

Datasheet - production data

**LGA-16 (4x4x1.1 mm<sup>3</sup>)**

### Features

- Wide supply voltage: 2.4 V to 3.6 V
- Selectable full scale (245/500/2000 dps)
- I<sup>2</sup>C/SPI digital output interface
- 16-bit rate value data output
- 8-bit temperature data output
- Two digital output lines (interrupt and data ready)
- Integrated low- and high-pass filters with user-selectable bandwidth
- Ultra-stable over temperature and time
- Low-voltage-compatible IOs (1.8 V)
- Embedded power-down and sleep mode
- Embedded temperature sensor
- Embedded FIFO
- High shock survivability
- Extended operating temperature range (-40 °C to +85 °C)
- ECOPACK<sup>®</sup>, RoHS and “Green” compliant

### Applications

- Industrial applications
- Navigation systems and telematics
- Motion control with MMI (man-machine interface)
- Appliances and robotics

### Description

The I3G4250D is a low-power 3-axis angular rate sensor able to provide unprecedented stability at zero-rate level and sensitivity over temperature and time. It includes a sensing element and an IC interface capable of providing the measured angular rate to the application through a standard SPI digital interface. An I<sup>2</sup>C compatible interface is also available.

The sensing element is manufactured using a dedicated micromachining process developed by STMicroelectronics to produce inertial sensors and actuators on silicon wafers.

The IC interface is manufactured using a CMOS process that allows a high level of integration to design a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The I3G4250D has a selectable full scale ( $\pm 245/\pm 500/\pm 2000$  dps) and is capable of measuring rates with a user-selectable bandwidth.

The I3G4250D is available in a plastic land grid array (LGA) package and can operate within a temperature range of -40 °C to +85 °C.

**Table 1. Device summary**

Order code	Temperature range (°C)	Package	Packing
I3G4250D	-40 to +85	LGA-16 (4x4x1.1 mm <sup>3</sup> )	Tray
I3G4250DTR	-40 to +85	LGA-16 (4x4x1.1 mm <sup>3</sup> )	Tape and reel

## 2 Mechanical and electrical characteristics

### 2.1 Mechanical characteristics

@ V<sub>dd</sub> = 3.0 V, T = +25 °C, unless otherwise noted<sup>(a)</sup>.

**Table 4. Mechanical characteristics**

Symbol	Parameter	Test condition	Min. <sup>(1)</sup>	Typ. <sup>(2)</sup>	Max. <sup>(1)</sup>	Unit
FS	Measurement range <sup>(3)</sup>	User-selectable		±245		dps
				±500		
				±2000		
So	Sensitivity <sup>(4)</sup>	FS = 245 dps	7.4	8.75	10.1	mdps/digit
		FS = 500 dps	14.8	17.50	19.8	
		FS = 2000 dps	59.2	70	79.3	
SoDr	Sensitivity change vs. temperature	From -40°C to +85°C		±2		%
DVoff	Digital zero-rate level <sup>(4)</sup>	FS = 245 dps	-25	±10	+25	dps
		FS = 500 dps	-37.5	±15	+37.5	
		FS = 2000 dps	-187.5	±75	+187.5	
OffDr	Zero-rate level change vs. temperature	FS = 245 dps		±0.03		dps/°C
		FS = 2000 dps		±0.04		
NL	Non linearity <sup>(3)</sup>	Best fit straight line	-5	0.2	+5	% FS
DST	Self-test output change	FS = 245 dps		130		dps
		FS = 500 dps		200		
		FS = 2000 dps		530		
Rn	Rate noise density	BW = 50 Hz		0.03		dps/ sqrt(Hz)
ODR	Digital output data rate			105/208/ 420/840		Hz
Top	Operating temperature range		-40		+85	°C

1. Minimum and maximum values are not guaranteed; based on characterization data.

2. Typical specifications are not guaranteed; typical values at +25 °C.

3. Guaranteed by design.

4. Min/Max values for DVoff are across temperature (-40°C to 85°C) and after MSL3 preconditioning. Based on characterization data. Not guaranteed and not tested in production.

a. The product is factory calibrated at 3.0 V. The operational power supply range is specified in [Table 5](#).

## 2.2 Electrical characteristics

@ Vdd = 3.0 V, T = +25 °C, unless otherwise noted <sup>(b)</sup>.

**Table 5. Electrical characteristics**

Symbol	Parameter	Test condition	Min. <sup>(1)</sup>	Typ. <sup>(2)</sup>	Max. <sup>(1)</sup>	Unit
Vdd	Supply voltage		2.4	3.0	3.6	V
Vdd_IO	I/O pins supply voltage <sup>(3)</sup>		1.71		Vdd+0.1	V
Idd	Supply current			6.1		mA
IddSL	Supply current in sleep mode <sup>(4)</sup>	Selectable by digital interface		1.5		mA
IddPdn	Supply current in power-down mode <sup>(5)</sup>	Selectable by digital interface		5		µA
Top	Operating temperature range		-40		+85	°C

1. Minimum and maximum values are not guaranteed; based on characterization data.
2. Typical specifications are not guaranteed; typical values at +25 °C.
3. It is possible to remove Vdd maintaining Vdd\_IO without blocking the communication busses, in this condition the measurement chain is powered off.
4. Sleep mode introduces a faster turn-on time compared to power-down mode.
5. Verified at wafer level.

## 2.3 Temperature sensor characteristics

@ Vdd = 3.0 V, T = 25 °C, unless otherwise noted <sup>(b)</sup>.

**Table 6. Temp. sensor characteristics**

Symbol	Parameter	Test condition	Min.	Typ. <sup>(1)</sup>	Max.	Unit
TSDr	Temperature sensor output change vs. temperature			-1		°C/digit
TODR	Temperature refresh rate			1		Hz
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed; typical values at +25 °C.

b. The product is factory calibrated at 3.0 V.

## 2.4 Communication interface characteristics

### 2.4.1 SPI - serial peripheral interface

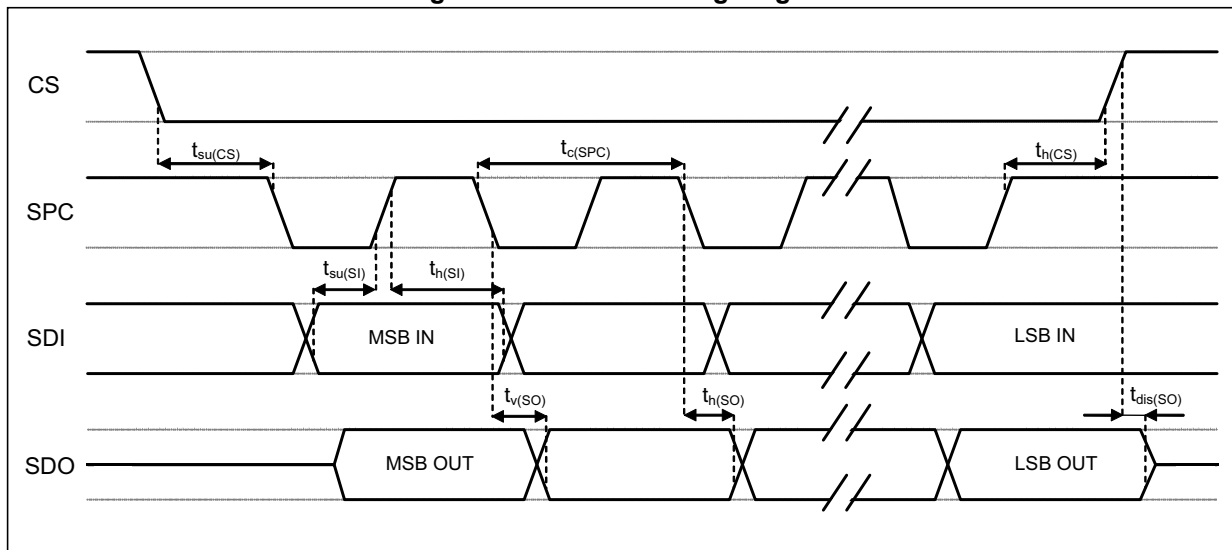

Subject to general operating conditions for Vdd and Top.

**Table 7. SPI slave timing values**

Symbol	Parameter	Value <sup>(1)</sup>		Unit
		Min.	Max.	
$t_{c(SPC)}$	SPI clock cycle	100		ns
$f_{c(SPC)}$	SPI clock frequency		10	MHz
$t_{su(CS)}$	CS setup time	5		ns
$t_{h(CS)}$	CS hold time	8		
$t_{su(SI)}$	SDI input setup time	5		
$t_{h(SI)}$	SDI input hold time	15		
$t_{v(SO)}$	SDO valid output time		50	
$t_{h(SO)}$	SDO output hold time	6		
$t_{dis(SO)}$	SDO output disable time		50	

1. Values are guaranteed at 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results; not tested in production.

**Figure 4. SPI slave timing diagram**

**Note:** Measurement points are done at  $0.2 \cdot V_{dd\_IO}$  and  $0.8 \cdot V_{dd\_IO}$ , for both input and output ports.

## 2.4.2 I<sup>2</sup>C - inter IC control interface

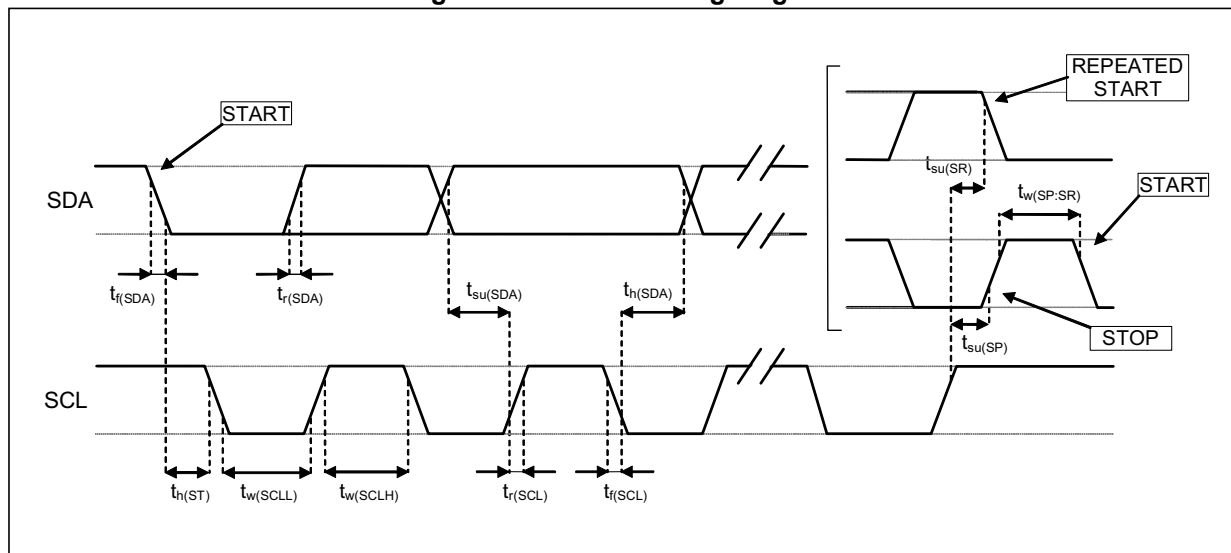

Subject to general operating conditions for V<sub>DD</sub> and T<sub>OP</sub>.

Table 8. I<sup>2</sup>C slave timing values

Symbol	Parameter	I <sup>2</sup> C standard mode <sup>(1)</sup>		I <sup>2</sup> C fast mode <sup>(1)</sup>		Unit
		Min.	Max.	Min.	Max.	
f <sub>(SCL)</sub>	SCL clock frequency	0	100	0	400	kHz
t <sub>w(SCLL)</sub>	SCL clock low time	4.7		1.3		μs
t <sub>w(SCLH)</sub>	SCL clock high time	4.0		0.6		
t <sub>su(SDA)</sub>	SDA setup time	250		100		ns
t <sub>h(SDA)</sub>	SDA data hold time	0	3.45	0	0.9	μs
t <sub>h(ST)</sub>	START condition hold time	4		0.6		μs
t <sub>su(SR)</sub>	Repeated START condition setup time	4.7		0.6		
t <sub>su(SP)</sub>	STOP condition setup time	4		0.6		
t <sub>w(SP:SR)</sub>	Bus free time between STOP and START condition	4.7		1.3		

1. Data based on standard I<sup>2</sup>C protocol requirement; not tested in production.

Figure 5. I<sup>2</sup>C slave timing diagram

Note: Measurement points are done at  $0.2 \cdot V_{DD\_IO}$  and  $0.8 \cdot V_{DD\_IO}$ , for both ports.

## 2.5 Absolute maximum ratings

Any stress above that listed as “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 9. Absolute maximum ratings**

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 4.8	V
T <sub>STG</sub>	Storage temperature range	-40 to +125	°C
Sg	Acceleration <i>g</i> for 0.1 ms	10,000	<i>g</i>
ESD	Electrostatic discharge protection	2 (HBM)	kV

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part

## 2.6 Terminology

### 2.6.1 Sensitivity

An angular rate gyroscope is a device that produces a positive-going digital output for counter-clockwise rotation around the axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time.

### 2.6.2 Zero-rate level

The zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and, therefore, the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time.

### 2.6.3 Stability over temperature and time

Thanks to the unique single-driving mass approach and optimized design, ST gyroscopes are able to guarantee a perfect match of the MEMS mechanical mass and the ASIC interface, and deliver unprecedented levels of stability over temperature and time.

With the zero-rate level and sensitivity performance, up to ten times better than equivalent products currently available on the market, the I3G4250D allows the user to avoid any further compensation and calibration during production for a faster time-to-market, easy implementation in applications, higher performance, and cost saving.

## 2.7 Soldering information

The LGA package is compliant with the ECOPACK<sup>®</sup>, RoHS and “Green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020.

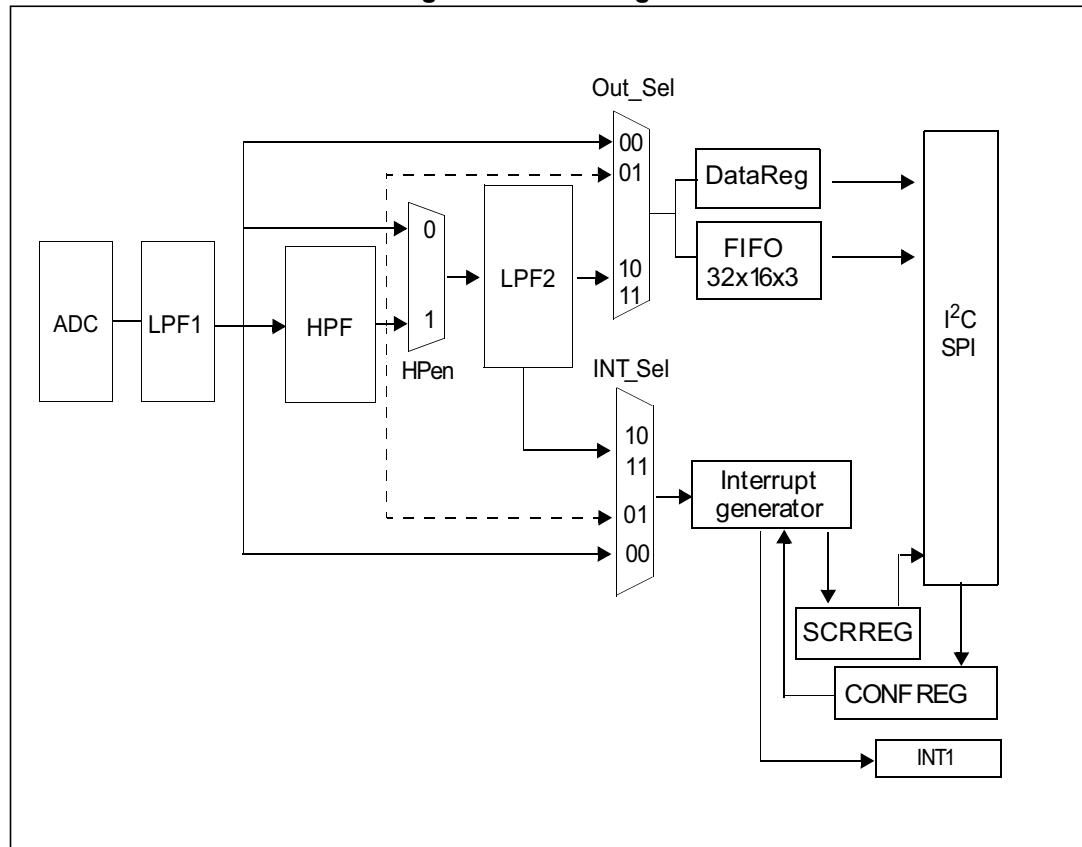

Leave “pin 1 indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at [www.st.com/](http://www.st.com/).

### 3 Main digital blocks

#### 3.1 Block diagram

Figure 6. Block diagram

#### 3.2 FIFO

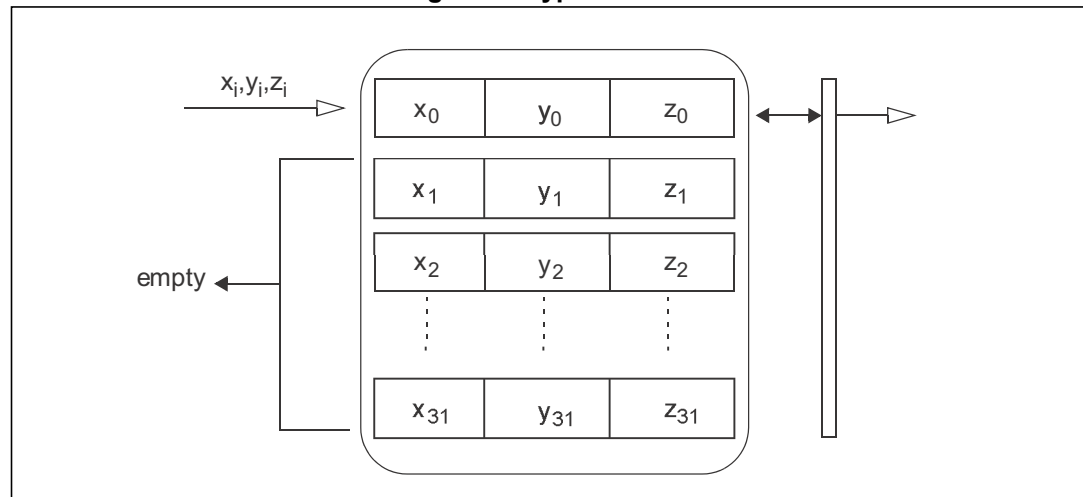

The I3G4250D embeds a 32-slot, 16-bit data FIFO for each of the three output channels: yaw, pitch, and roll. This allows consistent power saving for the system, as the host processor does not need to continuously poll data from the sensor. Instead, it can wake up only when needed and burst the significant data out from the FIFO. This buffer can work in three different modes. Each mode is selected by the FIFO\_MODE bits in [FIFO\\_CTRL\\_REG \(2Eh\)](#). Programmable watermark level, FIFO\_empty or FIFO\_Full events can be enabled to generate dedicated interrupts on the DRDY/INT2 pin (configured through [CTRL\\_REG3 \(22h\)](#)), and event detection information is available in [FIFO\\_SRC\\_REG \(2Fh\)](#). The watermark level can be configured using the WTM4:0 bits in [FIFO\\_CTRL\\_REG \(2Eh\)](#).

### 3.2.1 Bypass mode

In Bypass mode, the FIFO is not operational and for this reason it remains empty. As illustrated in [Figure 7](#), only the first address is used for each channel. The remaining FIFO slots are empty. When new data is available, the old data is overwritten.

Figure 7. Bypass mode

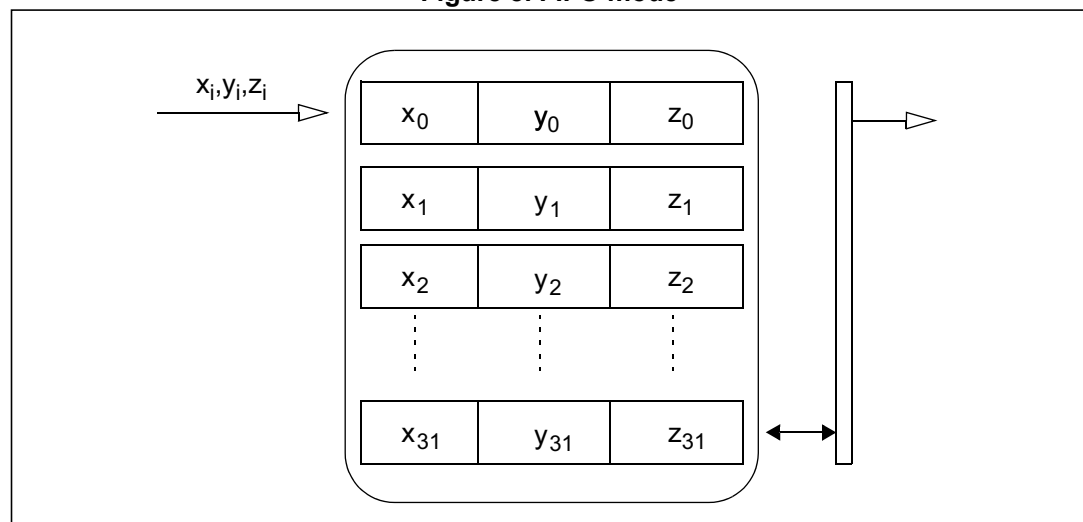

### 3.2.2 FIFO mode

In FIFO mode, data from the yaw, pitch, and roll channels are stored in the FIFO. A watermark interrupt can be enabled (I2\_WMK bit in [CTRL\\_REG3 \(22h\)](#)), which is triggered when the FIFO is filled to the level specified by the WTM 4:0 bits of [FIFO\\_CTRL\\_REG \(2Eh\)](#). The FIFO continues filling until it is full (32 slots of 16-bit data for yaw, pitch, and roll). When full, the FIFO stops collecting data from the input channels. To restart data collection, it is necessary to write [FIFO\\_CTRL\\_REG \(2Eh\)](#) back to Bypass mode.

FIFO mode is represented in [Figure 8](#).

Figure 8. FIFO mode

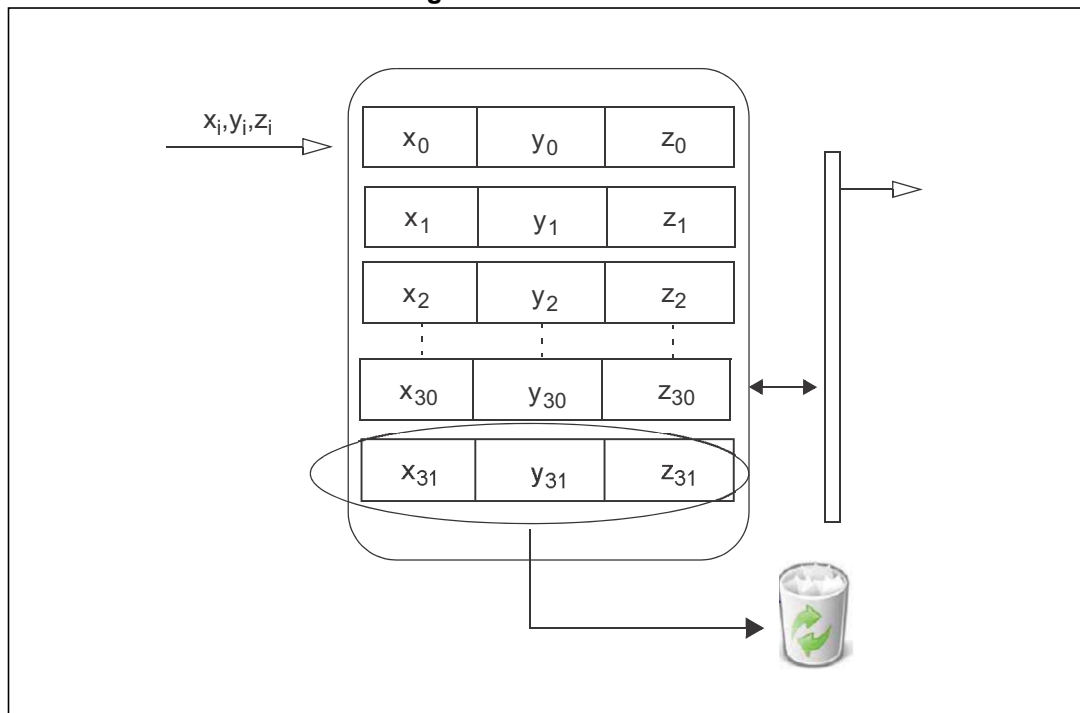

### 3.2.3 Stream mode

In Stream mode, data from yaw, pitch, and roll measurements are stored in the FIFO. A watermark interrupt can be enabled and set as in FIFO mode. The FIFO continues filling until full (32 slots of 16-bit data for yaw, pitch, and roll). When full, the FIFO discards the older data as the new data arrives. Programmable watermark level events can be enabled to generate dedicated interrupts on the DRDY/INT2 pin (configured through [CTRL\\_REG3 \(22h\)](#)).

Stream mode is represented in [Figure 9](#).

**Figure 9. Stream mode**

### 3.2.4 Retrieving data from FIFO

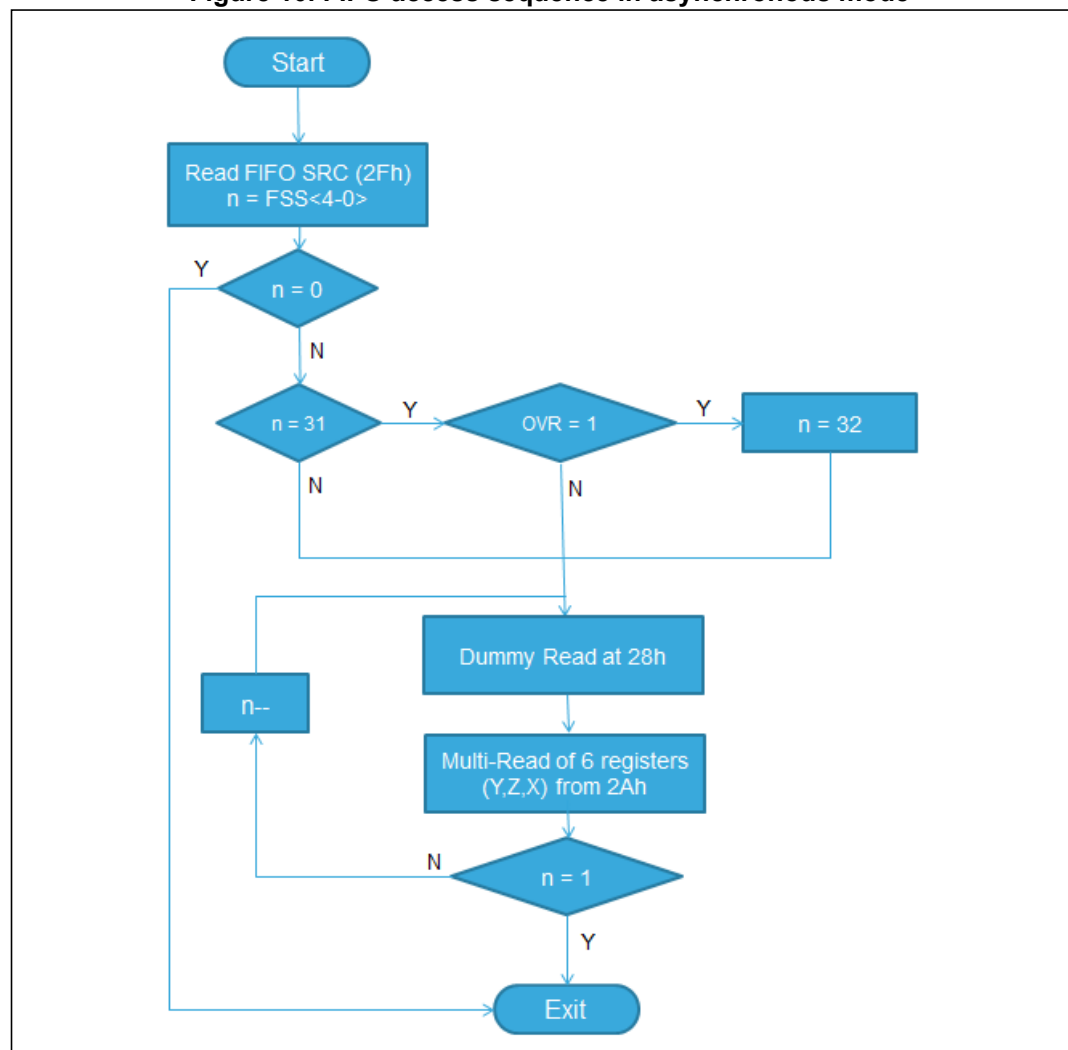

FIFO data is read from the OUT\_X, OUT\_Y, and OUT\_Z registers. When the FIFO is in Stream, Bypass or FIFO mode, a read operation to the OUT\_X, OUT\_Y or OUT\_Z registers provides the data stored in the FIFO. Each time data is read from the FIFO, the oldest pitch, roll, and yaw data are placed in the OUT\_X, OUT\_Y and OUT\_Z registers, and both single read and read-burst (X, Y & Z with auto-incremental address) operations can be used. In read-burst mode, when data included in OUT\_Z\_H is read, the system again starts to read information from OUT\_X\_L.

The read from FIFO may be executed either in synchronous or asynchronous mode. For correct data acquisition, the following points must be respected:

1. If reading is synchronous, all data should be acquired within one ODR cycle
2. If reading is asynchronous, an appropriate FIFO access sequence must be applied:
  - a) Single read from register 28h
  - b) Multi-read: sequentially reading 2Ah, 2Bh, 2Ch, 2Dh, 28h, 29h
  - c) This procedure must be repeated for each dataset (X/Y/Z) in the FIFO:
    - FSS times, if  $FSS \leq 31$
    - $(FSS + 1)$  times, if  $(FSS = 31) \& (OVR = 1)$

Figure 10 illustrates the correct sequence with a flow diagram:

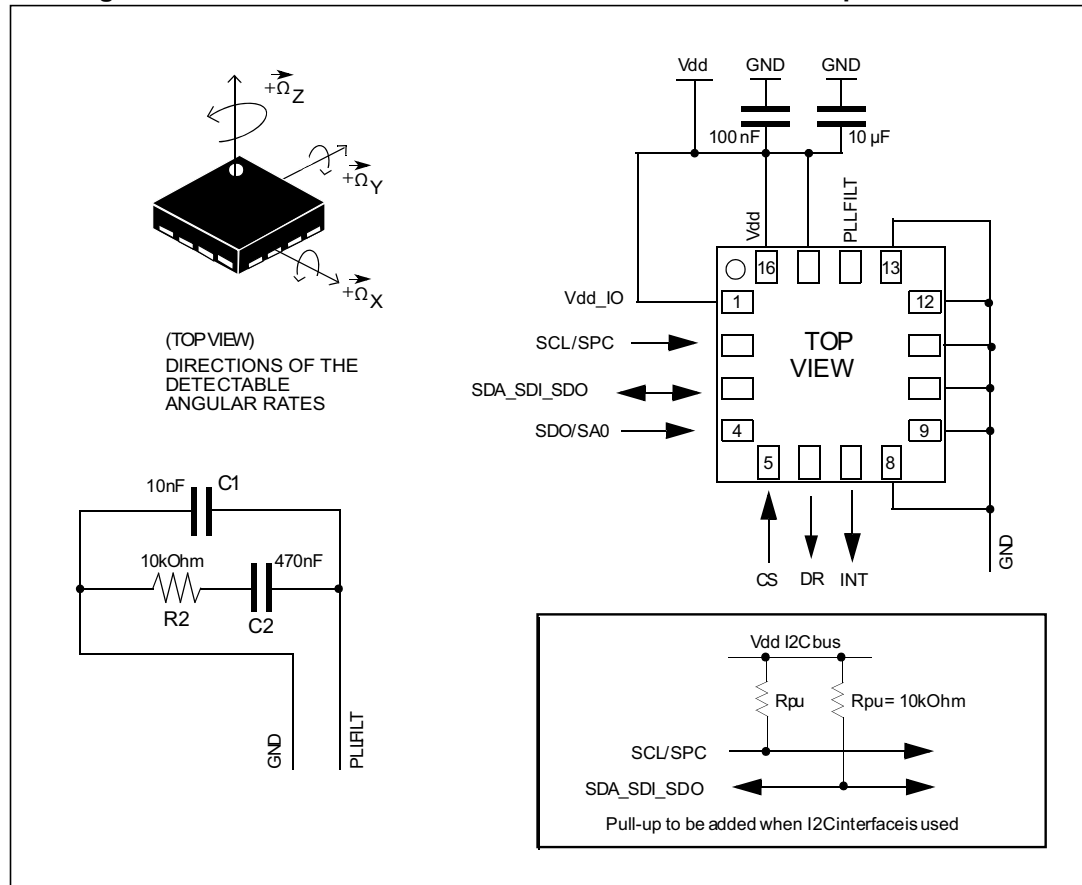

**Figure 10. FIFO access sequence in asynchronous mode**

If the above sequence is not followed, the acquisition from FIFO may lead to corrupted data.

## 4 Application hints

Figure 11. I3G4250D electrical connections and external component values

Power supply decoupling capacitors (100 nF ceramic or polyester +10 μF) should be placed as near as possible to the device (common design practice).

If Vdd and Vdd\_IO are not connected together, power supply decoupling capacitors (100 nF and 10 μF between Vdd and common ground, 100 nF between Vdd\_IO and common ground) should be placed as near as possible to the device (common design practice).

The I3G4250D IC includes a PLL (phase-locked loop) circuit to synchronize driving and sensing interfaces. Capacitors and resistors must be connected to the **PLLFILT** pin (as shown in [Figure 11](#)) to implement a second-order low-pass filter. [Table 10](#) summarizes the PLL low-pass filter component values.

Table 10. PLL low-pass filter component values

Component	Value
C1	10 nF ± 10%
C2	470 nF ± 10%
R2	10 kΩ ± 10%

## 5 Digital interfaces

The registers embedded in the I3G4250D may be accessed through both the I<sup>2</sup>C and SPI serial interfaces. The latter may be software-configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped to the same pins. To select/exploit the I<sup>2</sup>C interface, the CS line must be tied high (i.e., connected to Vdd\_IO).

**Table 11. Serial interface pin description**

Pin name	Pin description
CS	SPI enable I <sup>2</sup> C/SPI mode selection (1: SPI idle mode / I <sup>2</sup> C communication enabled; 0: SPI communication mode / I <sup>2</sup> C disabled)
SCL/SPC	I <sup>2</sup> C serial clock (SCL) SPI serial port clock (SPC)
SDA/SDI/SDO	I <sup>2</sup> C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
SDO	SPI serial data output (SDO) I <sup>2</sup> C least significant bit of the device address

### 5.1 I<sup>2</sup>C serial interface

The I3G4250D I<sup>2</sup>C is a bus slave. The I<sup>2</sup>C is employed to write data to registers whose content can also be read back.

The relevant I<sup>2</sup>C terminology is given in the table below.

**Table 12. I<sup>2</sup>C terminology**

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I<sup>2</sup>C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bi-directional line used for sending and receiving the data to/from the interface. Both lines must be connected to Vdd\_IO through an external pull-up resistor. When the bus is free both the lines are high.

The I<sup>2</sup>C interface is compliant with fast mode (400 kHz) I<sup>2</sup>C standards as well as with normal mode.

### 5.1.1 I<sup>2</sup>C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a HIGH to LOW transition on the data line while the SCL line is held HIGH. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first 7 bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The slave address (SAD) associated with the I3G4250D is 110100xb. The SDO pin can be used to modify the least significant bit (LSb) of the device address. If the SDO pin is connected to the voltage supply, LSb is '1' (address 1101001b). Otherwise, when the SDO pin is connected to ground, the LSb value is '0' (address 1101000b). This solution permits the connection and addressing of two different gyroscopes to the same I<sup>2</sup>C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I<sup>2</sup>C embedded in the I3G4250D behaves like a slave device, and the following protocol must be adhered to. After the START (ST) condition, a slave address is sent. Once a slave acknowledge (SAK) has been returned, an 8-bit sub-address is transmitted. The 7 LSb represent the actual register address while the MSb enables address auto-increment. If the MSb of the SUB field is 1, the SUB (register address) is automatically incremented to allow multiple data read/write.

The slave address is completed with a read/write bit. If the bit is '1' (read), a REPEATED START (SR) condition must be issued after the two sub-address bytes; if the bit is '0' (write) the master transmits to the slave with the direction unchanged. [Table 13](#) describes how the SAD+read/write bit pattern is composed, listing all the possible configurations.

**Table 13. SAD+read/write patterns**

Command	SAD[6:1]	SAD[0] = SDO	R/W	SAD+R/W
Read	110100	0	1	11010001 (D1h)
Write	110100	0	0	11010000 (D0h)
Read	110100	1	1	11010011 (D3h)
Write	110100	1	0	11010010 (D2h)

**Table 14. Transfer when master is writing one byte to slave**

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

**Table 15. Transfer when master is writing multiple bytes to slave**

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

**Table 16. Transfer when master is receiving (reading) one byte of data from slave**

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

**Table 17. Transfer when master is receiving (reading) multiple bytes of data from slave**

Master	ST	SAD+W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a receiver cannot receive another complete byte of data until it has performed some other function, it can hold the clock line SCL LOW to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver does not acknowledge the slave address (i.e., it is not able to receive because it is performing some real-time function) the data line must be left HIGH by the slave. The master can then abort the transfer. A LOW to HIGH transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

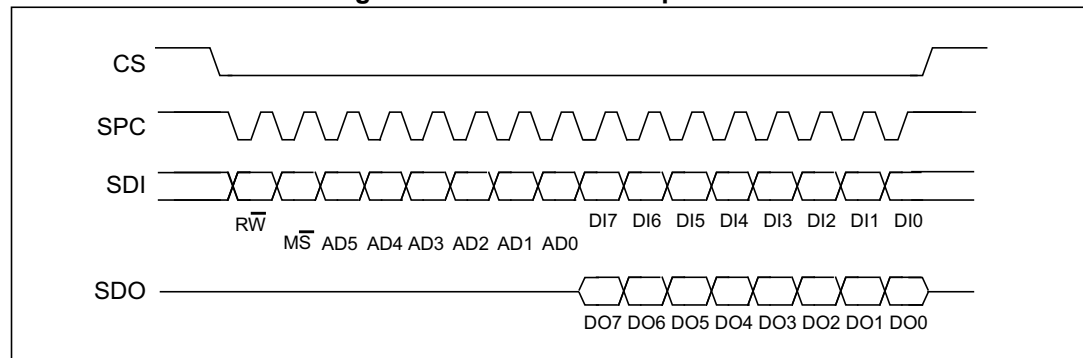

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1, while SUB(6-0) represents the address of the first register to be read.

In the presented communication format, MAK is “master acknowledge” and NMAK is “no master acknowledge”.

## 5.2 SPI bus interface

The SPI is a bus slave. The SPI allows writing to and reading from the device registers. The serial interface interacts with the application through 4 wires: **CS**, **SPC**, **SDI**, and **SDO**.

Figure 12. Read and write protocol

**CS** is the serial port enable and is controlled by the SPI master. It goes low at the start of the transmission and returns to high at the end. **SPC** is the serial port clock and is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. These lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses, or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, etc.) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

**Bit 0:**  $\overline{RW}$  bit. When 0, the data DI(7:0) is written to the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

**Bit 1:**  $\overline{MS}$  bit. When 0, the address remains unchanged in multiple read/write commands. When 1, the address is auto-incremented in multiple read/write commands.

**Bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**Bit 8-15:** data DI(7:0) (write mode). This is the data that is written to the device (MSb first).

**Bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

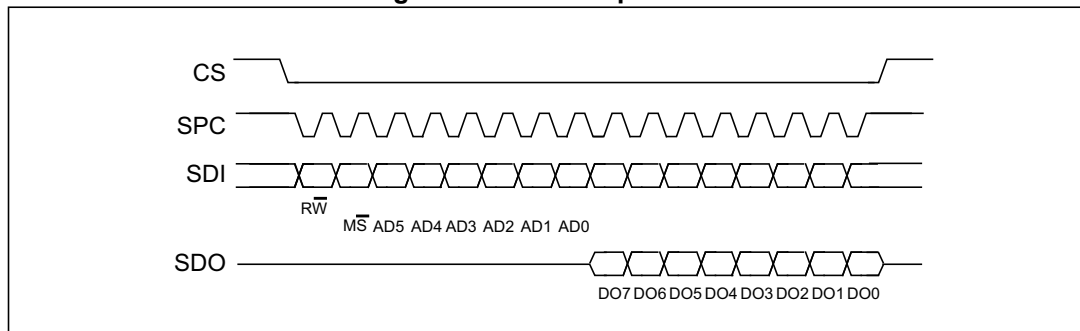

In multiple read/write commands, further blocks of 8 clock periods are added. When the  $\overline{MS}$  bit is 0, the address used to read/write data remains the same for every block. When the  $\overline{MS}$  bit is 1, the address used to read/write data is incremented at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

### 5.2.1 SPI read

Figure 13. SPI read protocol

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

**Bit 0:** READ bit. The value is 1.

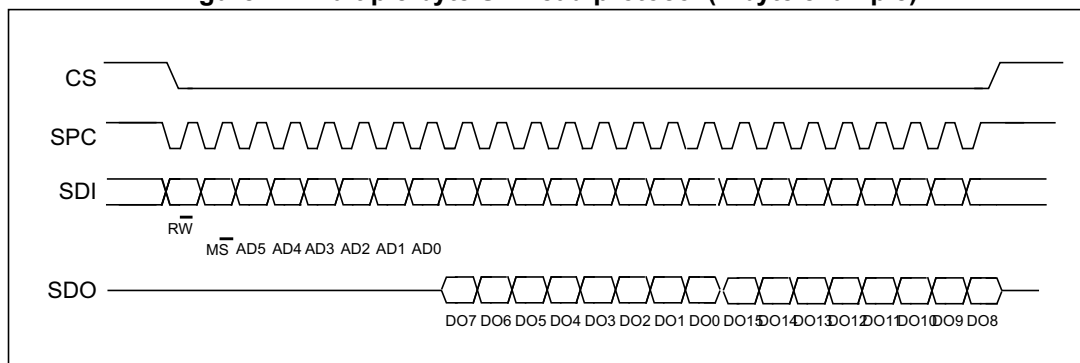

**Bit 1:**  $\overline{MS}$  bit. When 0, does not increment address; when 1, increments address in multiple reads.

**Bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**Bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

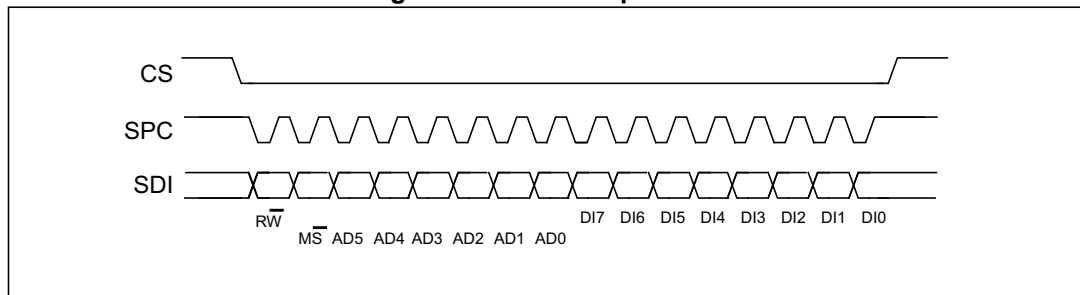

**Bit 16-...:** data DO(...-8). Further data in multiple byte reads.

Figure 14. Multiple byte SPI read protocol (2-byte example)

## 5.2.2 SPI write

Figure 15. SPI write protocol

The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

**Bit 0:** WRITE bit. The value is 0.

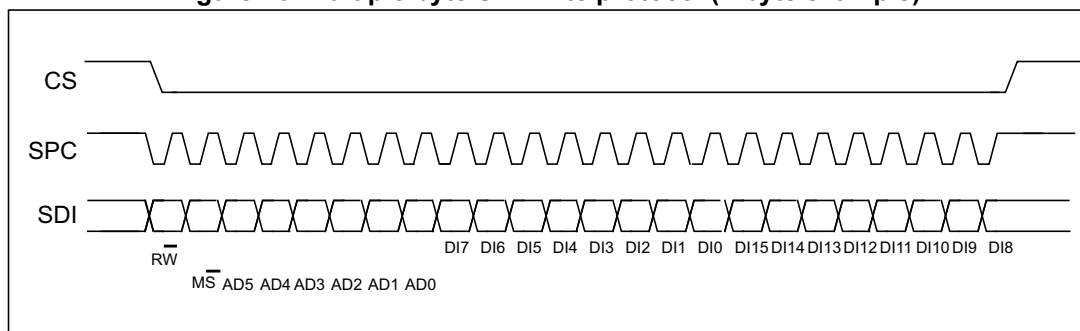

**Bit 1:**  $\overline{MS}$  bit. When 0, does not increment address; when 1, increments address in multiple writes.

**Bit 2 -7:** address AD(5:0). This is the address field of the indexed register.

**Bit 8-15:** data DI(7:0) (write mode). This is the data that is written to the device (MSb first).

**Bit 16-...:** data DI(...-8). Further data in multiple byte writes.

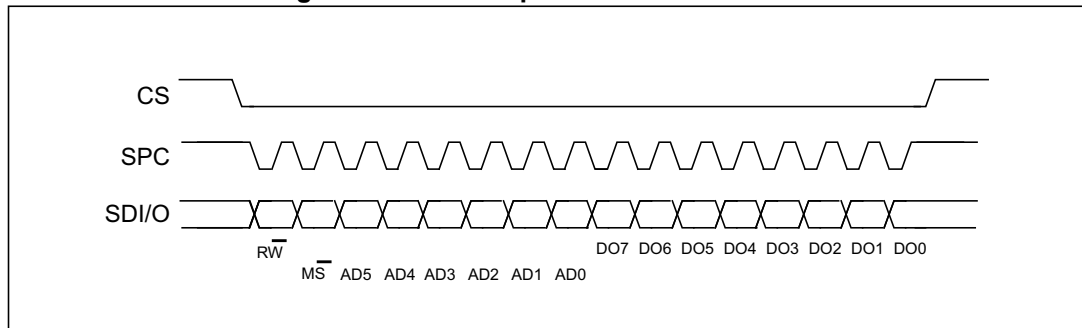

Figure 16. Multiple byte SPI write protocol (2-byte example)

### 5.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting the SIM (SPI serial interface mode selection) bit to 1 in *CTRL\_REG2 (21h)*.

**Figure 17. SPI read protocol in 3-wire mode**

The SPI read command is performed with 16 clock pulses:

**Bit 0:** READ bit. The value is 1.

**Bit 1:**  $\overline{MS}$  bit. When 0, does not increment address; when 1, increments address in multiple reads.

**Bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**Bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

*Note: If the I3G4250D is used in a multi-SPI slave environment (several devices sharing the same SPI bus), the gyroscope can be forced by software to remain in SPI mode. This objective can be achieved by sending, at the beginning of the SPI communication, the following sequence to the device:*

```
a = read(0x05)
```

```
write(0x05, (0x20 OR a))
```

The programming of this register makes it possible to enhance the robustness of the SPI.

## 6 Output register mapping

*Table 18* below provides a list of the 8-bit registers embedded in the device and the corresponding addresses.

**Table 18. Register address map**

Name	Type	Register address		Default

Registers marked as *Reserved* must not be changed. Writing to those registers may change calibration data and therefore lead to device malfunction.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

## 7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve rate data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

### 7.1 WHO\_AM\_I (0Fh)

**Table 19. WHO\_AM\_I register**

1	1	0	1	0	0	1	1
---	---	---	---	---	---	---	---

Device identification register.

### 7.2 CTRL\_REG1 (20h)

**Table 20. CTRL\_REG1 register**

DR1	DR0	BW1	BW0	PD	Zen	Yen	Xen
-----	-----	-----	-----	----	-----	-----	-----

**Table 21. CTRL\_REG1 description**

DR1-DR0	Output data rate selection. Refer to <a href="#">Table 22</a>
BW1-BW0	Bandwidth selection. Refer to <a href="#">Table 22</a>
PD	Power-down mode enable. Default value: 0 (0: power-down mode, 1: normal mode or sleep mode)
Zen	Z-axis enable. Default value: 1 (0: Z-axis disabled; 1: Z-axis enabled)
Yen	Y-axis enable. Default value: 1 (0: Y-axis disabled; 1: Y-axis enabled)
Xen	X-axis enable. Default value: 1 (0: X-axis disabled; 1: X-axis enabled)

**DR[1:0]** is used to set ODR selection. **BW [1:0]** is used to set bandwidth selection.

In the following table ([Table 22](#)) all frequencies resulting in a combination of DR / BW bits are given.

**Table 22. DR and BW configuration setting**

DR [1:0]	BW [1:0]	ODR [Hz]	Cutoff
00	00	100	12.5
00	01	100	25
00	10	100	25
00	11	100	25

Table 22. DR and BW configuration setting (continued)

DR [1:0]	BW [1:0]	ODR [Hz]	Cutoff
01	00	200	12.5
01	01	200	25
01	10	200	50
01	11	200	70
10	00	400	20
10	01	400	25
10	10	400	50

**Table 51. INT1\_SRC description**

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt; 1: Z low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
YL	Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL	X low. Default value: 0 (0: no interrupt, 1: X low event has occurred)

Interrupt source register. Read-only register.

Reading at this address clears the INT1\_SRC IA bit (and eventually the interrupt signal on the INT1 pin) and allows the refresh of data in the INT1\_SRC register if the latched option is chosen.

## 7.17 INT1\_THS\_XH (32h)

**Table 52. INT1\_THS\_XH register**

-	THSX14	THSX13	THSX12	THSX11	THSX10	THSX9	THSX8
---	--------	--------	--------	--------	--------	-------	-------

**Table 53. INT1\_THS\_XH description**

THSX14 - THSX8	Interrupt threshold. Default value: 0000 0000
----------------	---

## 7.18 INT1\_THS\_XL (33h)

**Table 54. INT1\_THS\_XL register**

THSX7	THSX6	THSX5	THSX4	THSX3	THSX2	THSX1	THSX0
-------	-------	-------	-------	-------	-------	-------	-------

**Table 55. INT1\_THS\_XL description**

THSX7 - THSX0	Interrupt threshold. Default value: 0000 0000
---------------	---

## 7.19 INT1\_THS\_YH (34h)

**Table 56. INT1\_THS\_YH register**

-	THSY14	THSY13	THSY12	THSY11	THSY10	THSY9	THSY8
---	--------	--------	--------	--------	--------	-------	-------

**Table 57. INT1\_THS\_YH description**

THSY14 - THSY8	Interrupt threshold. Default value: 0000 0000
----------------	---

## 7.20 INT1\_THS\_YL (35h)

Table 58. INT1\_THS\_YL register

THSR7	THSY6	THSY5	THSY4	THSY3	THSY2	THSY1	THSY0
-------	-------	-------	-------	-------	-------	-------	-------

Table 59. INT1\_THS\_YL description

THSY7 - THSY0	Interrupt threshold. Default value: 0000 0000
---------------	---

## 7.21 INT1\_THS\_ZH (36h)

Table 60. INT1\_THS\_ZH register

-	THSZ14	THSZ13	THSZ12	THSZ11	THSZ10	THSZ9	THSZ8
---	--------	--------	--------	--------	--------	-------	-------

Table 61. INT1\_THS\_ZH description

THSZ14 - THSZ8	Interrupt threshold. Default value: 0000 0000
----------------	---

## 7.22 INT1\_THS\_ZL (37h)

Table 62. INT1\_THS\_ZL register

THSZ7	THSZ6	THSZ5	THSZ4	THSZ3	THSZ2	THSZ1	THSZ0
-------	-------	-------	-------	-------	-------	-------	-------

Table 63. INT1\_THS\_ZL description

THSZ7 - THSZ0	Interrupt threshold. Default value: 0000 0000
---------------	---

## 7.23 INT1\_DURATION (38h)

Table 64. INT1\_DURATION register

WAIT	D6	D5	D4	D3	D2	D1	D0
------	----	----	----	----	----	----	----

Table 65. INT1\_DURATION description

WAIT	WAIT enable. Default value: 0 (0: disable; 1: enable)
D6 - D0	Duration value. Default value: 000 0000

The **D6 - D0** bits set the minimum duration of the interrupt event to be recognized. Duration steps and maximum values depend on the ODR chosen.

The **WAIT** bit has the following meaning:

Wait = '0': the interrupt falls immediately if the signal crosses the selected threshold.

Wait = '1': if the signal crosses the selected threshold, the interrupt falls only after the duration has counted a number of samples at the selected data rate, written into the duration counter register.

Figure 19. Wait disabled

Figure 20. Wait enabled

## 8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at [www.st.com](http://www.st.com). ECOPACK is an ST trademark.
