

CIPOS™ Micro IPM 600V/6A

IM231-L6S1B / IM231-L6T2B

Description

IM231-L6-series 3-phase Intelligent Power Modules (IPM) are designed for high-efficiency appliance motor drives such as air-conditioner fans and refrigerator compressors. These advanced IPMs, available in both surface mount and through-hole configurations, offer a combination of low $V_{CE(sat)}$ TRENCHSTOP™ IGBT6 technology and the industry benchmark rugged half-bridge drivers. The IPMs have several protection features including precise overcurrent protection and temperature feedback.

Features

- 600V 3-phase inverter including gate drivers & bootstrap function
- Low $V_{CE(sat)}$ TRENCHSTOP™ IGBT6
- Temperature monitor
- Accurate overcurrent shutdown ($\pm 5\%$)
- Fault reporting and programmable fault clear
- Advanced input filter with shoot-through protection
- Optimized dV/dt for loss and EMI trade offs
- Open-emitter for single and leg-shunt current sensing
- 3.3V logic compatible
- Isolation 2000VRMS, 1min

Potential Applications

- Air-conditioner fans
- Refrigerator compressors
- Ventilation fans & blower fans
- Low power motor drives

Product validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

2.2 Pin Descriptions

HIN(1,2,3) and LIN(1,2,3) (Low side and high side control pins)

These pins are positive logic and they are responsible for the control of the integrated IGBT. The Schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3V controller outputs. Pull-down resistor of about 800kΩ is internally provided to pre-bias inputs during supply start-up and an ESD diode is provided for pin protection purposes. Input Schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time T_{FILIN} . The filter acts according to Figure 4.

Figure 3 Input pin structure

Figure 4 Input filter timing diagram

The integrated gate drive provides additionally a shoot through prevention capability which avoids the simultaneous on-state of the high-side and low-side switch of the same inverter phase. A minimum deadtime insertion of typically 300ns is also provided by driver IC, in order to reduce cross-conduction of the external power switches.

V_{DD}, COM (Low side control supply and reference)

V_{DD} is the control supply and it provides power both to input logic and to the output power stage. Input logic is referenced to COM ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of V_{DDUV+} = 11.1V is present.

The IC shuts down all the gate drivers power outputs, when the V_{DD} supply voltage is below V_{DDUV-} = 10.9V. This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

V_{B(1,2,3)} and V_{S(1,2,3)} (High side supplies)

V_B to V_S is the high side supply voltage. The high side circuit can float with respect to COM following the external high side power device emitter voltage.

Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The under-voltage detection operates with a rising supply threshold of typical V_{BSUV+} = 11.1V and a falling threshold of V_{BSUV-} = 10.9V.

V_{S(1,2,3)} provide a high robustness against negative voltage in respect of COM. This ensures very stable designs even under rough conditions.

V_{R(1,2,3)} (Low side emitters)

The low side emitters are available for current measurements of each phase leg. It is recommended to keep the connection to pin COM as short as possible in order to avoid unnecessary inductive voltage drops.

VTH (Thermistor output)

A UL certified NTC resistor is integrated in the module with one terminal of the chip connected to COM and the other to VTH. When pulled up to a rail voltage such as V_{DD} or 3.3V by a resistor, the VTH pin provides an analog voltage signal corresponding to the temperature of the thermistor.

RFE (RCIN / Fault / Enable)

The RFE pin combines 3 functions in one pin: RCIN or RC-network based programmable fault clear timer, fault output and enable input.

The RFE pin is normally connected to an RC network on the PCB per the schematic in Figure 5. Under normal operating conditions, R_{RCIN} pulls the RFE pin to 3.3V, thus enabling all the functions in the IPM. The microcontroller can pull this pin low to disable the IPM functionality. This is the Enable function.

Pin Configuration

Figure 5 Typical PCB circuit connected to the RFE pin

The Fault function allows the IPM to report a Fault condition to the microcontroller by pulling the RFE pin low in one of two situations. The first is an under-voltage condition on V_{DD} and the second is when the ITRIP pin sees a voltage rising above $V_{IT,TH+}$.

The programmable fault clear timer function provides a means of automatically re-enabling the module operation a preset amount of time ($T_{FLT-CLR}$) after the fault condition has disappeared. Figure 6 shows the RFE-related circuit block diagram inside the IPM.

The length of $T_{FLT-CLR}$ can be determined by using the formula below.

$$V_{RFE}(t) = 3.3V * (1 - e^{-t/RC})$$

$$T_{FLT-CLR} = -R_{RCIN} * C_{RCIN} * \ln(1 - V_{IN,TH+}/3.3V)$$

For example, if R_{RCIN} is 1.2MΩ and C_{RCIN} is 1nF, the $T_{FLT-CLR}$ is about 1.7ms with $V_{IN,TH+}$ of 2.5V. It is also important to note that C_{RCIN} needs to be minimized in order to make sure it is fully discharged in case of over current event.

Since the ITRIP pin has a 500ns input filter, it is appropriate to ensure that C_{RCIN} will be discharged below $V_{IN,TH-}$ by the open-drain MOSFET, after 350ns. Therefore, the max C_{RCIN} can be calculated as:

$$V_{RFE}(t) = 3.3V * e^{-t/RC} < V_{IN,TH-}$$

$$C_{RCIN} < 500ns / (-\ln(V_{IN,TH-} / 3.3V) * R_{RFE_ON})$$

Consider $V_{IN,TH-}$ of 0.8V and R_{RFE_ON} of 50ohm, C_{RCIN} should be less than 7nF. It is also suggested to use a R_{RCIN} of between 0.5MΩ and 2MΩ.

These pins are motor U, V, W input pins.

V+ (Positive bus input voltage, Pin 23)

The high side IGBTs are connected to the bus voltage. It is noted that the bus voltage should not exceed 450V.
